

Move cancer control research to reality

Project Title	Move cancer control research to reality
Project Summary	Are you a detail-oriented story-teller passionate about public health and improving cancer outcomes for all communities? Help us leverage the rapidly-expanding field of implementation science to improve the uptake of evidence-based programs and interventions.
Country	United States

Project Description

The National Cancer institute recently published Implementation Science (IS) at a Glance: a Guide for Cancer Control Practitioners. We are interested in expanding this resource though additional case studies and other materials.

The successful applicant will connect with people in the field who are working on implementing evidence-based cancer control programs, gathering relevant details and “running the programs through” an implementation science framework. These “expanded case studies” would illuminate how to view public health practice through an IS lens.

We are confident that for the right person, this project could suit your professional goals - perhaps form the basis for a research/capstone project etc.

Required Skills or Interests

Skill(s)

Analytical writing

Data visualization

Educational design

Storytelling/bloggging/vlogging

Survey / polling design

Writing
